Your video conferencing solution says more about your business than you might think.

How your solution performs on the call can set the first impression with new clients, set the tone with existing partners and establish the effectiveness of internal meetings.

In fact, we'd argue that video conferencing solutions have never been as important, or in demand, as they are today. That's why we've opted for Poly video conferencing throughout our Headquarters. Poly's discreet and advanced video conferencing devices offer outstanding performance to ensure you always look and sound like a boss.

From supplying headsets for the moon landings in 1969, and riding with Virgin Hyperloop for its first successful passenger test, Poly has continually innovated and delivered outstanding business solutions for every situation.

Poly in Action: St John's Mill

Since it opened in 2003, St John's Mill has sought to provide businesses, charities, government departments, community groups and organisations with a first class event experience and has recently upgraded its facilities to accommodate the trend towards virtual and hybrid meetings.

The challenge

Driven by its mission to facilitate inspiring events and make customers lives as happy as possible, staff at St John's Mill quickly saw the potential for providing high quality online meetings and video conferencing to augment their beautiful physical meeting spaces, especially with the onset of the coronavirus pandemic.

"We have always strived to give our customers the best experience possible so they really get the most from their time with us,"

said Assistant Manager, Sarah Ripamonti.

Key to their success would be multi-functionality, ease of use and uninterrupted connectivity – plus the ability to install a new system in the face of public health restrictions!

With more people making use of services such as Zoom and the ongoing difficulties of meeting people in person, we were keen to make sure we were providing a way of connecting with others that was easy and enjoyable but would also be a smooth trouble-free process.
